

4PSA TOTAL BACKUP

BACKUP AND RESTORE WITH CONFIDENCE

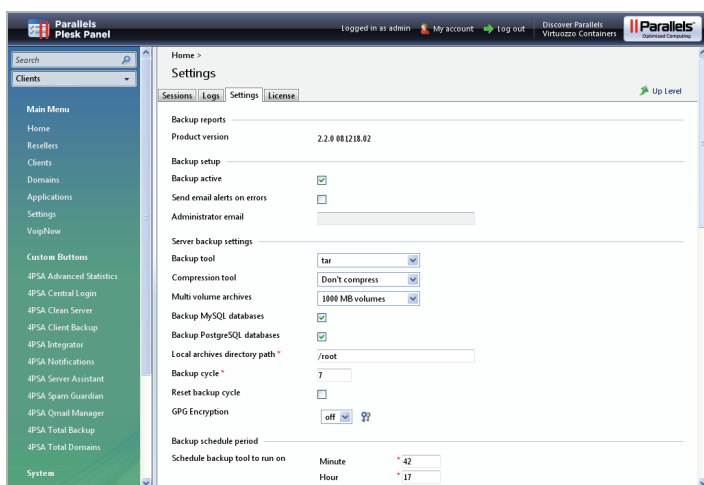

Thousands of businesses and individuals place their trust in their service provider, so it is vital for the latter to safeguard against data loss. With Total Backup businesses can automate backup processes while intelligently spending resources. Total Backup is trusted by thousands of hosting companies.

Backup with Confidence

Total Backup was the first backup solution on the market integrated in Parallels Plesk Panel and since then it has maintained a leading position due to its features and reliability. The product is based on Open Source standards and uses the tar format to store backup files. Backups can be used to restore the original files on any platform and can easily be recovered even if data corruption occurs at storage level.

Automated Backups

Total Backup reduces the disaster recovery plan setup time and allows administrators to easily implement policies. In less than a minute, they are able to configure the backup strategy, the backup interval, the storage directory, the backup content and location, as well as other parameters.

Security and Performance

Total Backup provides advanced security and guarantees that encrypted information is safe. Backups that contain sensitive information can be stored on public infrastructures without any reason of concern. The low-level backup engine is designed to reduce the consumption of resources used in backup tasks. In a backup cycle, the software can backup only changed files, lowering backup time and storage requirements.

Implement your Own Backup Policy

Total Backup can keep copies of the backup archives on a remote storage repository that can be accessed by means of several protocols. All remotely transferred backup files are checked for consistency and, if anything unusual occurs, the administrator is notified.

Storage clouds like Amazon S3 can be used to implement a disaster recovery plan that guarantees business continuity while minimizing costs.

Highlights

- Backup management under Parallels Plesk Panel
- Incremental backup capabilities
- Backup scheduling
- Backup encryption for storage on untrusted remote locations
- SSH, Amazon S3, and FTP remote storage
- Management of backup targets
- Multi-volume backups
- Restore wizard tool

Availability

Compatible with Plesk 9.x and Plesk 8.x servers running on Linux or FreeBSD. Virtuozzo templates are available.
