

4PSA OXTENDER FOR PLESK

SIMPLIFIED OPEN-EXCHANGE FOR PLESK MAILBOXES

OXtender for Plesk is the most convenient way to offer high-performance, best-in-class email service to your Parallels Plesk Panel customers. OXtender allows you to deliver true business class email features including groupware, collaboration and mobility using the award winning Open-Exchange, the social networks enabled alternative to Microsoft Exchange.

Fast Deployment

OXtender can be installed in less than five minutes. After configuring the module to connect to the Open-Exchange server, the Plesk administrator and customers can add OX services to existing and new mailbox accounts. OXtender automates all basic tasks in order to reduce the management overhead.

Affordable Licensing

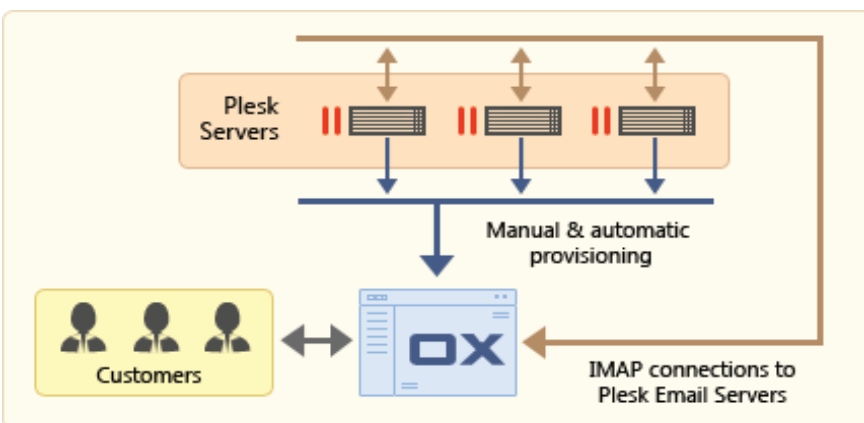

With the new OXtender for Plesk and the special Open-Exchange brought to you exclusively by 4PSA, you get a flat monthly price per Parallels Plesk server. There are no additional licensing fees for the Open-Exchange server!

No Infrastructure Changes

Open-Exchange does not change the Plesk email server, yet adds even more functionality on top of the existing infrastructure. This means that your customers will login to the Open-Exchange web interface as if they were accessing their former webmail. Then they will be able to access all of the new features with no changes to the email server settings.

Flexible Service Delivery Options

If your company has more than one Parallels Plesk server, it is recommended that a dedicated Open-Exchange machine or cluster be deployed. For companies with a single hosting server, where growth is not anticipated, the Open-Exchange server can be installed on the same machine.

New Opportunities

4PSA OXtender for Plesk allows you to deploy an advanced webmail application and replace the obsolete Plesk application. Your customers will love the AJAX interface that comes with a standard package including address book, calendar, and tasks. For paying business customers the advanced groupware can be deployed with a simple mouse click. They will now benefit from both private and public address book, InfoStore, calendar, teams, subscriptions and even mobility on Groupware Premium service. The mobility support includes: Symbian S60, Windows Mobile, iPhone, BlackBerry, and Android.

Highlights

- Flat fee per Plesk server, subscription-based licensing
- Five-minutes installation and configuration process
- Perfect integration in Parallels Plesk Panel interface
- Complete Unified Communications platform with VoipNow
